

Getting Started Guide

To get a patient started on Ferriprox® (deferiprone) follow **2 steps** outlined in this guide.

Indication

Ferriprox® (deferiprone) is an iron chelator indicated for the treatment of transfusional iron overload in patients with:

- thalassemia syndromes
- sickle cell disease or other anemias

Ferriprox Tablets are indicated in adult and pediatric patients ≥ 8 years of age; Ferriprox Oral Solution is indicated in patients ≥ 3 years of age.

Limitations of Use:

Safety and effectiveness have not been established for the treatment of transfusional iron overload in patients with myelodysplastic syndrome or in patients with Diamond Blackfan anemia.

Please see <u>full Prescribing Information</u>, including boxed WARNING and Medication Guide inside.

WARNING: AGRANULOCYTOSIS AND NEUTROPENIA

- Ferriprox can cause agranulocytosis that can lead to serious infections and death. Neutropenia may precede the development of agranulocytosis.
- Measure the absolute neutrophil count (ANC) before starting Ferriprox and monitor regularly while on therapy.
- Interrupt Ferriprox therapy if neutropenia develops.
- Interrupt Ferriprox if infection develops, and monitor the ANC more frequently.
- Advise patients taking Ferriprox to report immediately any symptoms indicative of infection.

Step 1:

Fill out the Physician Order/Prescription & Statement of Medical Necessity Form

	Physician Prescription/Or Statement of Medical Nec		Ferriprox(deferiprone 1000 mg tablets	Ferriprox deferiprone 1000 mg tablets 5000 mg tablets Oral solution 100 mg/mL	
	1. First prescription for the patient: Fax completed form to 1-866-565-7794 2. Subsequent prescription: May be e-script via EVERSANA Life Science Services Specialty Pharmacy in your EMR/HMR sys Call 1-866-758-7071 if you have questions regarding this form or contact Chiesi Total Care [™]

Important Safety Information

Ferriprox can cause fetal harm. Advise females of reproductive potential to use an effective method of contraception during treatment with Ferriprox and for at least six months after the last dose. Advise males with female partners of reproductive potential to use effective contraception during treatment with Ferriprox and for at least three months after the last dose. Advise females not to breastfeed during treatment with Ferriprox and for at least 2 weeks after the last dose.

Specify appropriate ICD-10 diagnosis code(s) for secondary diagnosis.

If patient has transfusional iron overload, <u>both</u> the **DIAGNOSIS** (primary diagnosis) and **DUE** to (secondary diagnosis) sections must be completed.

ICD-10 Diagnosis Code			
			Diagnosis
D55.8	Other anemias due to enzyme disorders	D61.89	
D56.1	Beta Thalassemia		
D56.8	Other Thalassemia	D61.9	
D57.1	Sickle Cell Disease	D63.8	
D57.8	Other Sickle Cell Disease	D64.1	
D58.1	Hereditary elliptocytosis	D64.3	
D58.9	Hereditary hemolytic anemia, unspecified	D64.4	
D59.5	Paroxysmal nocturnal hemoglobinuria [Marchiafava-Micheli]	D64.9	
D61.2	Aplastic anemia due to other	E83.111	
	external agents	E87.71	

Diagnosis	Current indication
D61.89	Other plastic anemias and other bone marrow failure syndromes
D61.9	Aplastic anemia, unspecified
D63.8	Anemia in other chronic diseases classified elsewhere
D64.1	Secondary sideroblastic anemia due to disease
D64.3	Other sideroblastic anemias
D64.4	Congenital dyserythropoietic anemia
D64.9	Anemia, unspecified
E83.111	Hemochromatosis due to repeated red blood cell transfusions
E87.71	Transfusion associated circulatory overload

Providers are responsible for ensuring the accuracy and validity of all billing and claims for appropriate reimbursement.

Specify formulation and titration schedule.

Increasing the dose of Ferriprox from 75 mg/kg/day up to 99 mg/kg/day may improve efficacy in iron chelation.^{1,2}

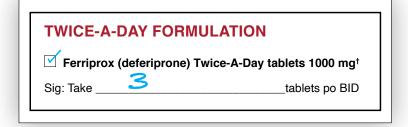

Titration schedule if needed:

Help to minimize gastrointestinal (GI) upset

Titrate Ferriprox by 15 mg/kg/day weekly.

Sample dosing assuming 60 kg patient @ 99 mg/kg/day (when no titration is required):

Sample titration assuming 60 kg patient titrating from 45 up to 60 mg/kg/day (with adjustment):

You may also attach separate instructions for titration schedule.

Write "Dispense as written" on prescriptions.

Important Safety Information

Avoid co-administration of Ferriprox with other drugs known to be associated with neutropenia or agranulocytosis; however, if this is unavoidable, closely monitor the absolute neutrophil count. Avoid co-administration with UGT1A6 inhibitors. Allow at least a 4-hour interval between administration of Ferriprox and drugs or supplements containing polyvalent cations (e.g., iron, aluminum, or zinc).

Please see full Prescribing Information, including boxed WARNING and Medication Guide inside.

Step 2:

Once you have completed the form:

1. Attach copies of patient insurance and prescription cards – front and back.

2. First prescription for the patient:

THE FIRST COPY OF THE FORM MUST BE FAXED FOR EACH PATIENT. Fax completed form to Chiesi Total CareSM at 1-866-565-7794. Please complete one form per patient.

3. Subsequent prescriptions:

If you wish to send subsequent forms via e-script please search for "Eversana Life Science Services Specialty Pharmacy" in your EMR/HMR's e-prescribing software

Indication

Ferriprox® (deferiprone) is an iron chelator indicated for the treatment of transfusional iron overload in patients with:

- thalassemia syndromes
- sickle cell disease or other anemias

Ferriprox Tablets are indicated in adult and pediatric patients ≥8 years of age; Ferriprox Oral Solution is indicated in patients ≥3 years of age.

Limitations of Use:

Safety and effectiveness have not been established for the treatment of transfusional iron overload in patients with myelodysplastic syndrome or in patients with Diamond Blackfan anemia.

Important Safety Information

WARNING: AGRANULOCYTOSIS AND NEUTROPENIA

- Ferriprox can cause agranulocytosis that can lead to serious infections and death. Neutropenia may precede the
 development of agranulocytosis.
- · Measure the absolute neutrophil count (ANC) before starting Ferriprox and monitor regularly while on therapy.
- Interrupt Ferriprox therapy if neutropenia develops.
- Interrupt Ferriprox if infection develops, and monitor the ANC more frequently.
- Advise patients taking Ferriprox to report immediately any symptoms indicative of infection.

Ferriprox is contraindicated in patients with known hypersensitivity to deferiprone or to any of the excipients in the formulations.

In pooled clinical trials, 7.5% of 642 patients with thalassemia syndromes treated with Ferriprox developed increased ALT values. Four (0.62%) Ferriprox-treated subjects discontinued the drug due to increased serum ALT levels and 1 (0.16%) due to an increase in both ALT and AST. In pooled clinical trials, 7.7% of 196 patients with sickle cell disease or other anemias treated with Ferriprox developed increased ALT values. Monitor serum ALT values monthly during therapy with Ferriprox and consider interruption of therapy if there is a persistent increase in the serum transaminase levels. Decreased plasma zinc concentrations have been observed on deferiprone therapy. Monitor plasma zinc annually, and supplement in the event of a deficiency.

Ferriprox can cause fetal harm. Advise females of reproductive potential to use an effective method of contraception during treatment with Ferriprox and for at least six months after the last dose. Advise males with female partners of reproductive potential to use effective contraception during treatment with Ferriprox and for at least three months after the last dose. Advise females not to breastfeed during treatment with Ferriprox and for at least 2 weeks after the last dose.

Avoid co-administration of Ferriprox with other drugs known to be associated with neutropenia or agranulocytosis; however, if this is unavoidable, closely monitor the absolute neutrophil count. Avoid co-administration with UGT1A6 inhibitors. Allow at least a 4-hour interval between administration of Ferriprox and drugs or supplements containing polyvalent cations (e.g., iron, aluminum, or zinc).

The most common adverse reactions in patients with thalassemia (incidence \geq 6%) are nausea, vomiting, abdominal pain, arthralgia, ALT increased and neutropenia. The most common adverse reactions in patients with sickle cell disease or other anemias (incidence \geq 6%) are pyrexia, abdominal pain, bone pain, headache, vomiting, pain in extremity, sickle cell anemia with crisis, back pain, ALT increased, AST increased, arthralgia, oropharyngeal pain, nasopharyngitis, neutrophil count decreased, cough and nausea.

Inform patients that their urine might show a reddish/brown discoloration due to the excretion of the iron-deferiprone complex. This is a very common sign of the desired effect, and it is not harmful.

Advise patients to avoid alcohol while taking Ferriprox tablets (twice-a-day). Consumption of alcohol while taking Ferriprox tablets (twice-a-day) may result in more rapid release of deferiprone.
